P2 – Electron Model from the Θ Field

Ing. David Jaroš

September 1, 2025

Goal

Demonstrate how a minimal electron-like solution can emerge from the internal structure of the unified $\Theta(q, \tau)$ field.

Approach

- Use the internal spinor/tensor decomposition of Θ.

- Map quantum numbers (charge, spin, mass) to components.

- Attempt derivation of mass term analogous to Dirac field in curved space.

Expected Outcome

A plausible geometric derivation of electron properties as a topological excitation in $\Theta(q, \tau)$.
